

# Data Analyst Professional Practical Exam Presentation

Dr. Anoushiravan zahedi

# Pens and Printer

- Founded in 1984 and provides high-quality office products
- New Products
- Sales Methods
  - Email
  - Call
  - Email and Call

# Data Validation

# Columns

| Column Name       | Details  | Required Modifications                |
|-------------------|--|---------------------------------------|
| week              | Week sale was made, counted as weeks since product launch  | NA                                    |
| customer_id       | Character, unique identifier for the customer  | Transformed to Category               |
| nb_sold           | Numeric, number of new products sold   | NA                                    |
| years_as_customer | years_as_customer Numeric, number of years customer has been buying from us(company founded in 1984) | Out of range values replaced with NaN |
| nb_site_visits    | Numeric, number of times the customer has visited our website in the last 6 months                   | NA                                    |
| state             | Character, location of the customer i.e. where orders are shipped                                    | Transformed to Category               |
| sales_method      | Character, which of the three sales methods were used for that customer                              | Cleaned & Transformed to Category     |
| revenue           | Numeric, revenue from the sales, rounded to 2 decimal places.  | Missing data                          |

# Sales Method

```
print(f"value counts for sales_method: \n{data['sales_method'].value_counts()}"")
```

| Sales Method | Count |
|--------------|-------|
| Email        | 7456  |
| Call         | 4962  |
| Email + Call | 2549  |
| em + call    | 23    |
| email        | 10    |

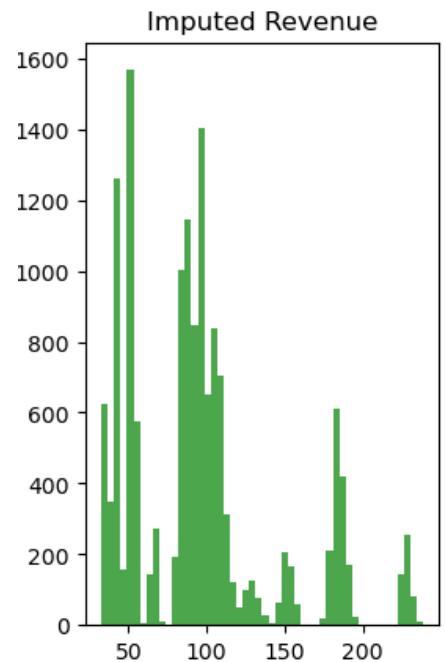

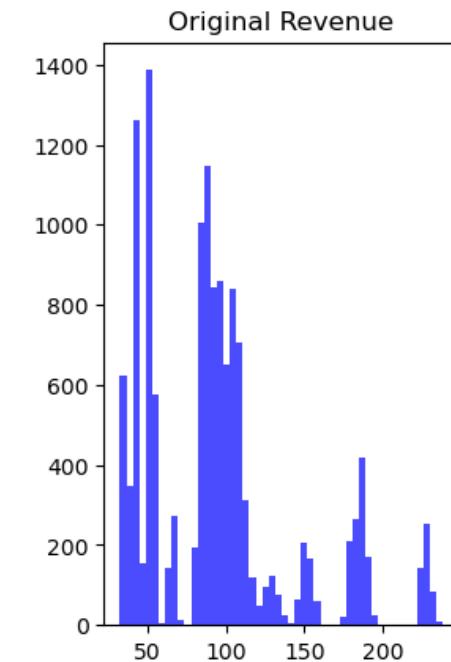

```
data['sales_method'] = data['sales_method'].str.replace('em ','email ').str.title().astype('category')
```

# Revenue

```
print(f"number of na in revenue grouped by sales_method: \\\n{data.groupby('sales_method', observed=False)['revenue'].apply(lambda x: x.isna().sum()/len(x))}")
```

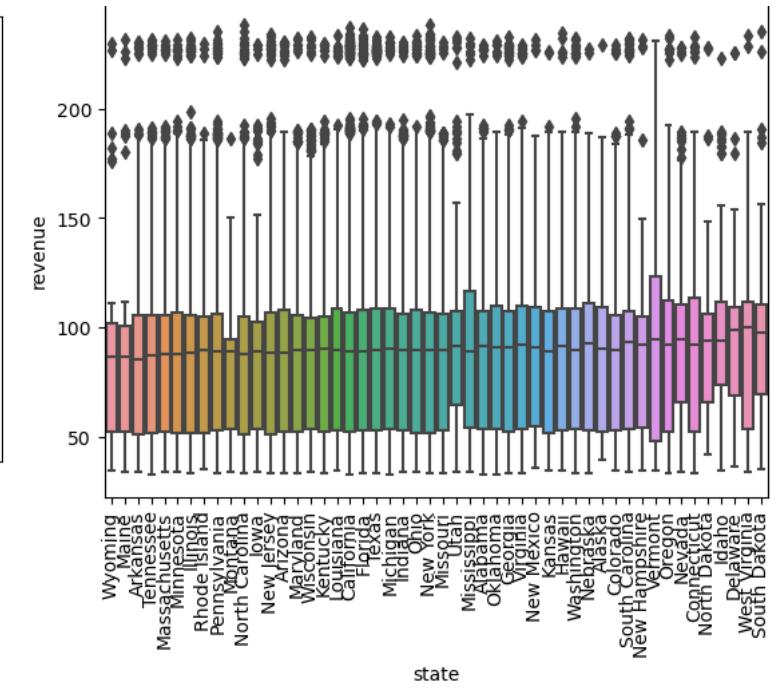

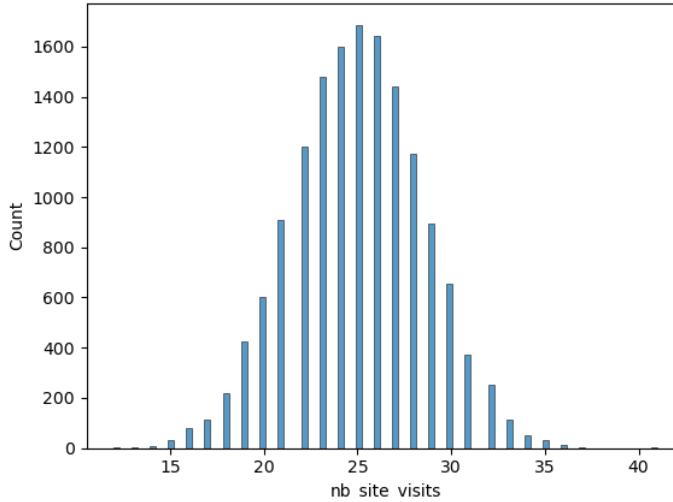

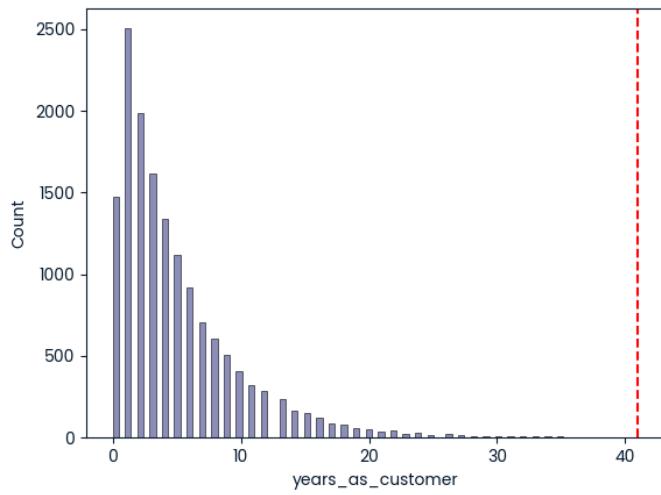

| Sales Method | Proportion of NA |
|--------------|------------------|
| Call         | 0.036477         |
| Email        | 0.072864         |
| Email + Call | 0.135692         |

```
data['revenue_filled'] = data.groupby('sales_method', observed=False)['revenue'].transform(lambda x: x.fillna(x.median()))
```

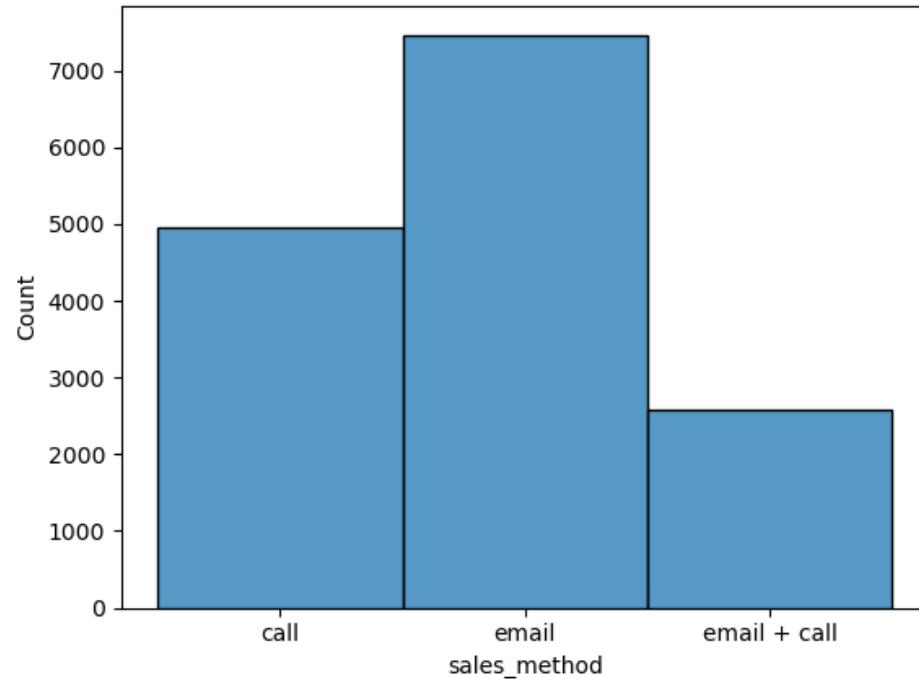

# Exploratory analysis

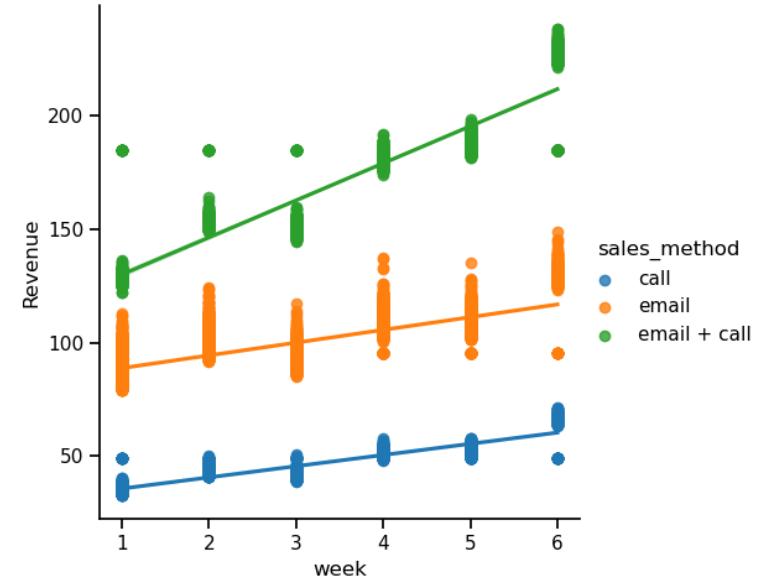

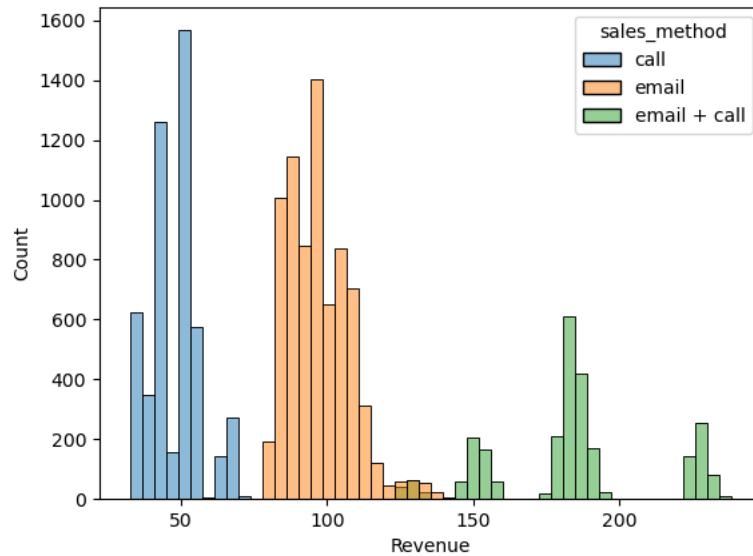

# Customers and their characteristics

# Allocation of customers to sales methods

# Revenue for different groups

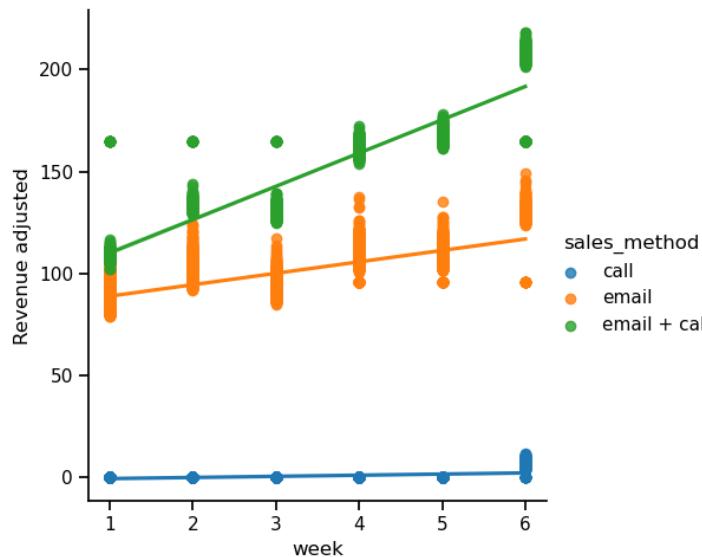

| Contrast     | A            | B            | U-val      | p-corr | hedges    |
|--------------|--------------|--------------|------------|--------|-----------|
| sales_method | email        | email + call | 15854.5    | 0.0    | -5.241444 |
| sales_method | email        | call         | 37046292.0 | 0.0    | 4.969941  |
| sales_method | email + call | call         | 12762264.0 | 0.0    | 7.903535  |

# Definition of a metric for the business

# Adjusted revenue

```
## finding a relevant metric
conditions = [
    data['sales_method'] == 'Email',
    data['sales_method'] == 'Call',
    data['sales_method'] == 'Email + Call',
]
choice = [0,30,10]
data['time_used'] = np.select(conditions, choice)
```

```
time_cost=2
data['revenue_adj'] = np.maximum(data['revenue_filled']-data['time_used']*time_cost,0)
```

| A            | B            | U-val      | p-corr | hedges    |
|--------------|--------------|------------|--------|-----------|
| email        | email + call | 15854.5    | 0.0    | -5.241444 |
| email        | call         | 37046292.0 | 0.0    | 4.969941  |
| email + call | call         | 12762264.0 | 0.0    | 7.903535  |

# Conclusions

1. Email & call > Email > Call
2. The differences between the sales methods are significant.
3. Using adjusted revenue

Thank  
you
